

## **Focus Area 16: Maternal, Infant, and Child Health**

**Objective 16-3c** targets the reduction in deaths among young adults aged 20-24 years to a rate of 49.0 per 100,000 population.

A total of 2,146 deaths among young adults aged 20-24 were reported in 2004, at a rate of 82.4 per 100,000 population (Figure 16-3c, Table 16-3c). California's death rates for young adults aged 20-24 were significantly higher than the target established in HP2010, and no significant trend was found between 2000 and 2004.

Examined by gender, death rates for males aged 20-24 (121.6 per 100,000 in 2004) were significantly higher than those for females aged 20-24 (38.7 per 100,000 in 2004). The HP2010 objective is being achieved for females, but not for males aged 20-24 as of 2004.

Data by race-ethnicity show that the highest reliable death rates among young adults aged 20-24 were for African Americans/Blacks (150.6 per 100,000 population in 2004). Their rates were significantly higher than the death rates for all other racial and ethnic populations aged 20-24, and significantly higher than the HP2010 target. The next highest death rates among young adults aged 20-24 were found for Whites (84.9 per 100,000 in 2004), and for Hispanics/Latinos (80.4 per 100,000 in 2004). The HP2010 objective is not being achieved for any of these racial and ethnic populations. The HP2010 objective is being achieved for Asians aged 20-24 (47.8 per 100,000 in 2004) and for "Multirace" persons aged 20-24 (46.4 per 100,000 in 2004). Unreliable death rates due to a small number of events were found for the American Indian/Alaska Native and the Pacific Islander populations aged 20-24 years, and are not reported here.
